A Project Proposal Report on

Social Media Platform (DevDoko)

(A Web-Based Social Networking Platform for Developers)

1. Project Overview

DevDoko is a specialized web-based social networking platform designed exclusively for developers to facilitate professional networking, knowledge sharing, and community collaboration. By integrating core social media functionalities with developer-centric features, DevDoko addresses the fragmentation developers face when using multiple generic platforms. Built using Laravel and MySQL following MVC architecture, this platform will provide a seamless, secure, and intuitive environment for developers to connect, share technical content, and grow professionally.

2. Problem Statement

Right now, developers use many different websites and apps to do different things:

- They use GitHub to store code
- LinkedIn for finding jobs and professional contacts
- Twitter/X for quick tech news
- Reddit or Stack Overflow to ask questions
- Slack or Discord to chat with teams

This means a developer might have 5-6 tabs open just to stay connected. There isn't one place where developers can do all of these activities together. DevDoko solves this by bringing everything into one platform, saving time and keeping conversations focused on coding and tech.

3. What DevDoko Will Do (Vision & Goals)

Our main goal is to create a friendly, useful online home for developers where they can:

- Share what they're working on
- Learn from other developers
- Find help with coding problems
- Connect with people who use the same technology
- Build a public profile of their projects and skills

4. Objectives and Scope

4.1 Objectives

- To design and develop a developer-centric social networking platform
- To enable content sharing through posts, comments, likes, and replies
- To provide follow and unfollow functionality for networking
- To implement real-time or near real-time notifications
- To facilitate direct messaging between developers
- To develop the system using Laravel and MySQL following MVC architecture

4.2 Scope

In Scope

- User registration, authentication, and authorization
- Developer profile creation and management
- Post creation, editing, liking, commenting, sharing, and saving
- Follow and unfollow system
- Notification system for user interactions
- Direct messaging between users
- Search functionality for users and content
- Web-based access through modern browsers

Out of Scope

- Mobile application development
- AI-based content recommendations
- Video streaming and live sessions

5. How We Will Build It (Technology)

5.1 Frontend

- HTML/CSS: For structure and styling
- Bootstrap: To make it look good on phones and tablets
- JavaScript: For interactive parts like likes and real-time notifications

5.2 Backend (The Brains Behind the Site)

- PHP with Laravel: A powerful and secure framework that handles:
    - User accounts
    - Storing posts and comments
    - Managing followers, Sending notifications
- MySQL Database: Where all data (users, posts, messages) is stored safely.

5. Feasibility Study and Risk Analysis

5.1 Feasibility Study

Technical Feasibility

The system will be developed using Laravel-11, open-source PHP framework, and MySQL as the database management system. These technologies are widely used, well-documented, and suitable for scalable web applications. The developer has adequate knowledge and experience in Laravel-based development.

Operational Feasibility

The system is designed to be intuitive and user-friendly, requiring minimal learning effort. Users familiar with existing social media platforms can easily adapt to DevDoko.

Economic Feasibility

The project utilizes open-source technologies, minimizing development and deployment costs. The system can be hosted on affordable web servers, making it economically viable.

6. Tools, Technologies

6.1 Tools and Technologies

- **Frontend:** HTML, CSS, JavaScript, Bootstrap
- **Backend:** PHP, Laravel Framework
- **Database:** MySQL
- **Version Control:** Git and GitHub
- **Development Environment:** Localhost (XAMPP)

7. Methodology and Timeline

7.1 Methodology

The project follows an **Agile-based iterative and modular development approach**. The system is developed in small iterations where features are designed, implemented, tested, and integrated incrementally.

Development is divided into independent modules such as authentication, profiles, posts, interactions (likes, comments, replies), messaging, notifications, and follow/unfollow functionality. Each module is tested individually before system integration to ensure stability and maintainability.

Regular testing and feedback are incorporated throughout the development process to improve performance, functionality, and user experience. Laravel's MVC architecture and MySQL database support structured, scalable, and efficient development.

7.2 Timeline

Week	Activity
1	Requirement analysis and system design
2-4	Backend Development
4-5	Frontend Development
6	Integration and Testing

8. Expectations and Conclusion

8.1 Expectations

- A fully functional web-based social networking platform for developers
- Secure and centralized data management
- Interactive user interface with core social media features
- Improved communication and collaboration among developers

8.2 Conclusion

DevDoko is proposed as a dedicated social networking platform aimed at enhancing communication and collaboration within the developer community. By integrating commonly used social media features into a developer-focused system, the project addresses the limitations of existing platforms. The system is technically feasible, economically viable, and operationally efficient. The project is expected to meet academic requirements and demonstrate practical application of web development concepts using Laravel and MySQL.
